

## Elementary Chemistry (Classic Reprint)

Excerpt from Elementary Chemistry A course in elementary chemistry suitable for the average high-school student should give a description of the common elements, their compounds, and their reactions, sufficiently clear and full to enable him to form correct conceptions of the nature of the changes that are going on around him. But it should do more; as far as is possible in an elementary course, it should provide him with a thorough groundwork in the simpler laws and theories of modern chemistry. This gives meaning and coherence to what would otherwise be fragments of knowledge, and lays a solid foundation for the continuation of the study of chemistry. The descriptive matter should impose as little strain as possible on the students memory. To accomplish this the facts should be properly coordinated with one another and duly correlated with the experiences of everyday life. General points of view should be emphasized and isolated details suppressed. Important historical items should be mentioned, for they put life into the subject and give it perspective. The laws of chemistry should be introduced in immediate connection with the discussion of those substances which first present typical applications of each law. The treatment of the laws should be full and varied. Reference to them should be made frequently throughout the course, so that they may become a permanent working possession of the student. The modern theories of physical chemistry should receive the attention their importance demands. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books.
