

Topics in Quantum Mechanics (Progress in Mathematical Physics) (Volume 27)

This self-contained text presents quantum mechanics from the point of view of some computational examples with a mixture of mathematical clarity often not found in texts offering only a purely physical point of view. Emphasis is placed on the systematic application of the Nikiforov--Uvarov theory of generalized hypergeometric differential equations to solve the Schrödinger equation and to obtain the quantization of energies from a single unified point of view.
