

Introduction to Metallurgical Chemistry for Technical Students (Classic Reprint)

It is becoming more evident every year that the aim in an evening technical school should be rather to increase the general capability of a large number of students than to turn out a few highly-trained men. This end will be best attained by making the subjects taught as self-contained as possible. The plan of this book is simple. It assumes that those who use it are practically interested in the common metals, and that they have no further knowledge of their properties than has been obtained by ordinary observation in a workshop or foundry, so that it is necessary to commence their scientific treatment at the very beginning. The physical properties of the metals and their alloys being fully treated in standard works on metallurgy, more than a passing notice is not devoted to this very important part of the study of metals. Brief references to the more useful properties will be found in different parts of the text. The greater portions of the chapters are taken up with a description of the chemical properties of the common metals, and in the development of chemical principles the metals are made to take as prominent a part as possible. The non-metals are, for the purpose of this book, regarded more as the servants of the metals than as their masters; but this is not from any want of appreciation of their importance, and it is hoped that the common ones are sufficiently described to make them quite familiar. Such of the nonmetals as are not of importance in dealing with the chemistry of the metals are either entirely omitted or only briefly noticed, further study being left for a more advanced stage of the subject. The practical work begins with the study of the effects of air and water on metals. (Typographical errors above are due to OCR software and do not occur in the book.) About the Publisher Forgotten Books is a publisher of historical writings, such as: Philosophy, Classics, Science, Religion,
