

Organic Syntheses (Collective Volume 1, Being a Revised Edition of Annual Volumes I-IX)

Organic Syntheses is an annual publication of satisfactory methods for the preparation of organic chemicals. Each set of directions has been tested by checking in a laboratory other than that of the contributor. The first volume appeared in 1921, and volume 11 was published in 1931. The present collective volume represents a thorough revision of the material contained in the first nine volumes. There are several objectives for this collective volume, the realization of which, it is hoped, will extend the usefulness of the series. First, it is convenient to have a large number of preparations in a single volume. Second, new and improved directions are included to replace or supplement earlier preparations. The new directions are for adipic acid, benzoic acid, cyclohexylcarbinol, dibenzoylmethane, d-glutamic acid, glycine, dl-methylethylacetic acid, pentaerythritol, and n-propylbenzene. Third, a large number of relatively minor but significant corrections have been made, and many suggestions have been incorporated for improving specific preparations. Fourth, the large number of preparations contained in a collective volume makes it more practicable to have several useful indexes. Illustrations of apparatus have been redrawn, and the quantities of corrosive liquids and of solvents have been given both in cubic centimeters and in grams.
